

Comprehending the Semantic Essence of Text: Leveraging SEANCE for Textual Analysis

Instructor: Lingzi Hong & Xiaoying Song

Presenter Profile

- Presenter: Lingzi Hong
- Assistant Professor in Data Science at the University of North Texas
- Research Interest:
 - Computational Linguistics
 - Human-Centered Computing
 - Social Media Analysis
 - Data Literacy

Presenter Profile

- Presenter: Xiaoying Song
- PhD Student in Information Science at the University of North Texas
- Research Interest:
 - Large Language Models
 - Online Misbehavior
 - Counter Speech
 - User Information Behavior

Outline

- ❖ **Theoretical Part (35 minutes)**
 - ❖ Natural Language Processing
 - ❖ Text Analysis
 - ❖ SEANCE for Text Analysis
 - ❖ Results Interpretation
- ❖ **Demonstrations (15 minutes)**
 - ❖ Setting Up SEANCE
 - ❖ Running SEANCE
 - ❖ Statistical Test
- ❖ **Q&A (10 minutes)**

01

Theoretical Part

Natural Language Processing

Definition

Natural language processing (NLP) is the ability of a computer program to understand human language as it's spoken and written -- referred to as natural language.

Application

Several NLP tasks break down human text and voice data in ways that help the computer make sense of what it's ingesting, such as sentiment analysis, named entity recognition, natural language generation.

Applications of NLP in Libraries

Text Mining and Analysis

- ❖ **Scenario:** The City Library receives a lot of feedbacks about the service through emails, social media, and surveys. Librarians hope to understand user needs and gauge satisfaction with existing materials and services.
- ❖ **Methods:** Automatic analysis of sentiment and entities through NLP tools.
- ❖ **Example insights:** Users desire more e-book collection; Users are not satisfied with certain activity for children; Users would like to see more new books; etc.

Applications of NLP in Libraries

Digital Archiving and Preservation

- ❖ **Scenario:** The Heritage Library has a significant collection of historical texts, including handwriting manuscripts, old newspapers, and government documents. The library needs to preserve these invaluable resources and make them accessible.
- ❖ **Methods:** Extraction of text from images. Automatic analysis of entities through NLP tools.
- ❖ **Example Results:** NLP tools automatically transcribe the text from scanned images. These transcribed texts are then annotated using NLP techniques to identify and tag key entity information, such as dates, names, and places.

Text Analysis

- ❖ Text analysis, a branch of Natural Language Processing (NLP), involves the automated processing of unstructured text to extract and categorize pertinent information using various techniques.
- ❖ These techniques include topic extraction, sentiment analysis, aspect classification, and named entity extraction, among others.

Technique that computers use
to extract worthwhile information
to extract worthwhile
information from the human
language in a smart
and efficient manner.

**Text
Analysis**

Examples

- ❖ **App Review: "I absolutely loved the smooth interface and easy navigation of this app!"**
 - ❖ Sentiment: Positive
 - ❖ Emotion: Joy
 - ❖ Named Entity: App
 - ❖ Topic Category: Technology/Product Review
- ❖ **Social Media Feedback: "The Wi-Fi at City Library is so slow. It's frustrating trying to get any work done. #librarywoes!"**
 - ❖ Sentiment: Negative
 - ❖ Emotion: Frustration
 - ❖ Named Entity: City Library
 - ❖ Topic Category: Library Complaint

SEntiment Analysis and Cognition Engine

Instructions

1. Select desired indices, types of words to analyze, and whether negation control is desired.
2. Choose the input folder (where your files are).
3. Select the folder you want the output file to go in.
4. Give a name to the output file.
5. Press the 'Process Texts' button.
6. Please reference the SEANCE Index Spreadsheet and the SEANCE help file (www.kristopherkyle.com) for further assistance in interpreting the output.

SEANCE

- ❖ SEANCE is a sentiment analysis tool that relies on a number of preexisting sentiment, social-positioning, and cognition dictionaries.
- SEANCE contains a number of predeveloped word vectors developed to measure sentiment, cognition, and social order. These vectors are taken from freely available source databases
- SEANCE is written in Python but is implemented in a way that requires little to no knowledge of programming, and it can be started by simply double-clicking the SEANCE icon.

Source Database

GI	Seventeen semantic categories: semantic dimensions, pleasure, overstatements, institutions, roles, social categories, references to places, references to objects, communication, motivation, cognition, pronouns, assent and negation, and verb and adjective types.
Lasswell	Nine semantic categories: power, rectitude, respect, affection, wealth, wellbeing, enlightenment, and skill.
GALC	Emotion: 36 specific emotions and two general emotional states (positive and negative).
ANEW	Effective norms for valence, pleasure, arousal, and dominance.
EmoLex	Lists of words and bigrams that evoke particular emotions (e.g., anger, anticipation, disgust, fear, joy, sadness, surprise, and trust).
SENTIC	Emotional dimensions (sensitivity, aptitude, attention, and pleasantness)
VADER	A rule-based sentiment analysis system developed specifically for shorter texts found in social media contexts.
Hu-Liu	Polarity list developed specifically for product reviews and social texts.

Indices Examples

- ❖ **Arousal, Arousal_nwords:** These indices measure the level of arousal, which refers to the intensity of emotion provoked by words. High arousal words typically trigger a strong emotional response (e.g., excitement, alarm).
- ❖ **Valence, Valence_nwords:** Valence indices measure the positive or negative sentiment conveyed by words. Positive valence indicates pleasantness, while negative valence points to unpleasantness.
- ❖ **Longing_GALC, Lust_GALC, Anger_GALC**
 - ❖ Longing: Reflects a yearning or desire for something.
 - ❖ Lust: Associated with intense desire, often in a sexual context.
 - ❖ Anger: Measures expressions of irritability, frustration, and rage.

Indices References

Index	Variable description	Variable Category	examples (not POS specific)
1 Arousal	Arousal	Arousal	Norms
2 Arousal_nwords	Arousal	Arousal	Norms
3 Dominance	Dominance	Dominance, respect, money, and power	Norms
4 Dominance_nwords	Dominance	Dominance, respect, money, and power	Norms
5 Valence	Valence	Valence/polarity	Norms
6 Valence_nwords	Valence	Valence/polarity	Norms
7 Longing_GALC	Longing	Arousal	crav*, daydream*, desir*, fanta*, hanker*
8 Lust_GALC	Lust	Arousal	carnal, lust*, climax, ecsta*, orgas*
9 Anger_GALC	Anger	Negative Emotion words	anger, angr*, cross*, enrag*, furious
10 Anxiety_GALC	Anxiety	Negative Emotion words	anguish*, anxi*, apprehens*, diffiden*, jitter*
11 Boredom_GALC	Boredom	Negative Emotion words	bor*, ennui, indifferen*, languor*, tedi*
12 Contempt_GALC	Contempt	Negative Emotion words	contempt*, denigr*, deprec*, deris*, despi*
13 Desperation_GALC	Desperation	Negative Emotion words	deject*, desolat*, despair*, desperat*, despond*
14 Disappointment_GALC	Disappointment	Negative Emotion words	comedown, disappoint*, discontent*, disenchant*, disgruntl*
15 Disgust_GALC	Disgust	Negative Emotion words	abhor*, avers*, detest*, disgust*, dislik*
16 Dissatisfaction_GALC	Dissatisfaction	Negative Emotion words	dissatisf*, unhapp*
17 Envy_GALC	Envy	Negative Emotion words	envious*, envy*
18 Fear_GALC	Fear	Negative Emotion words	afraid*, aghast*, alarm*, dread*, fear*
19 Guilt_GALC	Guilt	Negative Emotion words	blame*, contriti*, guilt*, remorse*, repent*
20 Hatred_GALC	Hatred	Negative Emotion words	acrimon*, hat*, rancor*
21 Irritation_GALC	Irritation	Negative Emotion words	annoy*, exasperat*, grump*, indign*, irrita*
22 Jealousy_GALC	Jealousy	Negative Emotion words	covetous*, jealous*
23 Sadness_GALC	Sadness	Negative Emotion words	chagrin*, deject*, dole*, gloom*, glum*

Benefits Using SEANCE for Text Analysis

01

Comprehensive
Analysis

02

Dimensionality
Reduction

03

Quantitative
Insights

04

Sentiment
Analysis

Example of Text Analysis Results by SEANCE

Text: "The library's new online catalog system is very user-friendly and efficient. The staff is always willing to help, although the website sometimes loads slowly."

nwords	negative_adjectives_component	positive_adjectives_component	politeness_component
20	-0.30	0.85	0.25

nwords: The total number of words in the text.

negative_adjectives_component: Indicates the presence and intensity of negative adjectives. A negative value suggests the presence of some negative comments such as "loads slowly".

positive_adjectives_component: Positive value indicates the presence of positive adjectives such as "user-friendly," "efficient," and "help".

politeness_component: Moderate indications of politeness or formal language, as seen in the respectful critique "although the website sometimes loads slowly".

What to do with Text Analysis Results?

Identify Common Issues:

- Aggregate negative feedback, count the frequency of entities mentioned in the text.

Compare user sentiment before and after the implementation of new services:

- Statistical comparison of the sentiment element in user feedback in two periods.

Statistic Test

Wilcoxon Rank Sum Test

- Nonparametric: Does not assume the data follow a specific distribution.
- Independent Samples: Compares two groups that are not related.
- Median Comparison: Tests whether the medians of two groups differ.

Example

Suppose a librarian wants to compare the effects of two different services for youth. They collect data user feedbacks about two services, conduct text analysis to identify sentiment.

- Group A (Service 1): 5 social media posts
- Group B (Service 2): 5 social media posts

The positive sentiment intensity for each social media post in the groups is as follows:

- Group A: 0.3, 0.5, 0.7, 0, 0.2
- Group B: 0, 0, 0.1, 0.5, 0.2

Hypotheses:

- **Null Hypothesis (H0):** The positive sentiment for both services is the same.
- **Alternative Hypothesis (H1):** The positive sentiment differs between the two services.

Example

The Wilcoxon Rank Sum Test (Mann-Whitney U test) results are as follows:

- U Statistic: 12.0
- p-value: 0.31473916375196484

Interpretation:

Given the p-value (0.31473916375196484), which is greater than the common significance level of 0.05, we fail to reject the null hypothesis. This suggests that there is not enough evidence to conclude that the positive sentiment differs between the two services.

02

Demonstrations

Setting up SEANCE

The image shows the SEANCE 1.2.0 web application interface. It features a sidebar on the left with the SEANCE logo and a list of links. The main content area is titled 'Sentiment Analysis and Cognition Engine' and contains several sections for configuring the analysis. The 'Instructions' section lists six steps for using the tool. The 'Indices' section has checkboxes for selecting all or none of various sentiment indices. The 'Words to Analyze' section has checkboxes for selecting all words or specific parts of speech. The 'Components' and 'Negation Control' sections have checkboxes for selecting components and negation control. The 'Data Input' section has text boxes for selecting an input folder and an output filename. The 'Run Program' section has a 'Process Texts' button. The 'Program Status' section shows the current status of the program.

Input text

0.txt

Mentally challenged individuals tend to be highly intelligent so to use that as a way to describe something as stupid is ignorant.

Run SEANCE

1. Select desired indices, types of words to analyze, and whether negation control is desired.
2. Choose the input folder (where your files are).
3. Select the folder you want the output file to go in.
4. Give a name to the output file.
5. Press the 'Process Texts' button.
6. Please reference the SEANCE Index Spreadsheet and the SEANCE help file (www.kristopherkyle.com) for further assistance in interpreting the output

The image shows a screenshot of the SEANCE web application interface, which has an orange background. The interface is organized into several sections:

- Indices:** A section with two rows of checkboxes. The first row has 'Select All' (checked), GALC (checked), EmoLex (checked), ANEW (checked), and SENTIC (checked). The second row has 'Select None' (checked), VADER (checked), Hu-Liu (checked), GI (checked), and Lasswell (checked).
- Words to Analyze:** A section with a row of checkboxes: 'All Words' (checked), Nouns (unchecked), Verbs (unchecked), Adjectives (unchecked), and Adverbs (unchecked). Below this is a sub-section with 'Components' (checked) and 'Negation Control' (unchecked, with 'Three Left' as an option).
- Data Input:** A section with a 'Select Input Folder' button. Below it, a text box shows 'Your selected input folder: .../SEANCE_input'.
- Choose Output Filename:** A section with a 'Choose Output Filename' button. Below it, a text box shows 'Your selected filename: .../results.csv'.
- Run Program:** A section with a 'Process Texts' button.
- Program Status:** A section with a text box showing '...Waiting for Data to Process'.
